

DRAGON MOSQUITO CONTROL, INC

TOWN OF HAMPTON

Year End Report 2012

In compliance with the 2012 Special Permit **SP-005**, this report is being submitted for the **Town of Hampton**.

NUMBER OF APPLICATIONS:

| | |
|------------------------------|------|
| Larviciding freshwater sites | 23 |
| Larviciding salt marsh sites | 104 |
| Larviciding catch basins | 1572 |
| Adulticiding by backpack | 4 |
| Adulticiding by truck | 23 |

TOTAL PESTICIDE APPLIED:

| | | |
|---------------------|------|---------|
| VectoBac GS | 1137 | pounds |
| AquaBac 200 S | 270 | pounds |
| BVA-2 MLO | 4.7 | gallons |
| Agnique MMF | 0.3 | gallons |
| Altosid Pellets WSP | 24.3 | pounds |
| Anvil 10+10 ULV | 60.3 | gallons |
| Zenivex E20 | 9.6 | gallons |
| Cross Check 7.9% | 6.6 | gallons |
| Permanone 10% EC | 0.8 | gallons |

BRIEF ASSESSMENT:

A mild winter coupled with an early spring gave many insects the advantage in 2012. Mosquito development was well underway in April when control programs began for most towns. The lack of rain kept many mosquito species suppressed so the overall population was normal or below normal for the summer. There were several exceptions to this occurrence. Populations of *Coquillettidia perturbans*, *Ochlerotatus sollicitans* and *Culex salinarius* were abundant this season.

Widespread West Nile Virus (WNV) and Eastern Equine Encephalitis (EEE) activity prompted unprecedented demand for emergency adulticiding not seen since 2005. Nineteen towns were sprayed during the WNV and EEE outbreak, including two new towns. During the peak of the arboviral season, some towns were sprayed two or three times. Most communities received spot treatment of high use sites such as schools and athletic fields. Light trap results showed a marked decline in the adult mosquito population after sites were sprayed. CrossCheck does not kill mosquitoes upon contact but will provide a four week residual which helps reduce repeated applications. Permanone 10 EC is still used for areas that need immediate control but only provides a two week residual in most situations. CrossCheck use is up from previous years due

in part to the increased demand for emergency spraying and our increased reliance on the product because of the long residual quality.

When control is needed for a large area, town wide spraying with our truck mounted ULV sprayers is recommended. The ULV sprayers are also used for large sites such as parks or school grounds. Anvil 10+10 and Zenivex E20 were used for ULV applications. The drawback to ULV application is no residual activity, completely weather dependent and no control over where it drifts. While backpack applications can be targeted toward specific areas where mosquitoes are resting, ULV application works by drifting with the wind and killing mosquitoes in its path.

Spraying was conducted in preparation for events such as high school graduations, and football games. Backpack applications were used to achieve the desired outcome. Control results were excellent for these events based upon resident comments and crew observations. Light trap results backed up the field observations.

We were very pleased with control results from both ULV and backpack applications during the arboviral season. No WNV or EEE positive mosquitoes were found in Hampton. Town wide ULV applications were conducted throughout the season. Resident complaints were abundant during a two week period in August when a hatch of salt marsh mosquitoes occurred. The complaints calmed down after road spraying was conducted to knock down the mosquito population.

The main component of our control program is larviciding wetlands using Bti. After relying on the same brand for decades, we tried a different brand of Bti this summer. Initial results seemed mixed with lower mortality rates than the competitor. This was evident during our mortality checks, light trap results and by an increase in resident complaints down around the salt marshes. We will continue to investigate the cause of this difference next season to determine if the results were caused by applicator error, resistance issues or poor quality control of the product.

Salt marshes were treated regularly with the tides. Many sites did not receive a full flood, therefore only a partial treatment of the marshes was needed. Lack of rain and high salinity levels favored species like *Oc. sollicitans* over *Oc. cantator*. Freshwater sites were very dry throughout the majority of the summer. Dry sites do not produce mosquitoes so the population rapidly declined. This was the second dry summer in a row.

Catch basin mosquitoes were active in many communities prompting two treatments to suppress these species. The lack of rain and thereby lack of water being flushed out of the basins allowed several broods of mosquitoes to occur. Altosid WSP was used to achieve residual control of catch basin mosquitoes with good results.

Agnique MMF and BVA-2 Mosquito Larvicide are used to control mosquito pupae. Both products perform well. Agnique MMF is favored in areas where livestock may come into contact with the water. Agnique has a longer residual than BVA. When it comes to coverage and immediate control, BVA outscores Agnique MMF. Agnique takes longer to achieve control especially in cold water common during springtime conditions.
